

Oral Sensitive 30

**By Pam Kaufman, Veterinary Technician
Royal Canin USA**

Dental hygiene is of utmost importance in the overall health of the adult cat. When oral health becomes compromised, bacteria can enter the bloodstream, affecting other organ systems in the body. Dental plaque is composed of bacteria and food residues deposited on the surface of the tooth. When calcium binds to the plaque, tartar is formed. Tartar is a hard crust that harbors bacteria, leading to gingivitis and more severe dental disease. Royal Canin Oral Sensitive 30 has a special kibble shape and texture, as well as a calcium binder. These unique kibble characteristics help produce a brushing effect when chewed and limit tartar formation.

Many healthy adult cats have problems with frequent vomiting. Sometimes this simply occurs because the pet has hairballs. Other times, cats may regurgitate after rapid eating. Because this unique kibble shape and texture promotes chewing, it reduces the ingestion rate of the food. The moderate fat content and the special blend of fibers help to optimize the speed of gastric emptying and intestinal transit. Certain fibers encourage the passage and elimination of ingested hair rather than the unfavorable result of finding the hairballs on the carpet. Slowing the pet's ingestion, optimizing the evacuation of the stomach, and improving the rate of intestinal transit all help to reduce the risk of vomiting in cats with reflux or hairballs.

Oral Sensitive 30 combines all of these features into one complete and balanced diet for adult cats that focuses on healthy oral hygiene, reflux control and hairball control.
